Although the greatest care was taken regarding the information in this catalogue, we assume no responsibility for any errors. We reserve the right to make changes.

The illustrations in the catalogue represent the described products, but delivered parts may differ in some respects from the illustrations.

The right is reserved to make changes in design and dimensions compared with the information in the catalogue in order enable development of designs, material and manufacturing methods.

The customer is reminded that in the purchase of our products for professional use or other, there is supplementary, current information that could not be included in the catalogue in terms of recommendations on each product's suitability regarding different combinations of the comprehensive product line of Movomech.

All relevant information must be provided to the persons who are responsible for the use of the product.

## ABOUT LIGHTWEIGHT OVERHEAD CRANE SYSTEMS

This product catalogue describes the various components in the Mechrail range of equipment and basic rules for selection. The product catalogue supports other sales tools for a correct selection of products. This document contains standard products available in price lists and sales configurator as well as some special applications that require handling by the Movomech sales support department.

### TERMINOLOGY FOR OVERHEAD ALUMINIUM CRANE SYSTEMS

#### Aluminium crane systems

A system with aluminium profiles in which trolleys, suspensions, lifting equipment and accessories are attached in order to provide ergonomic and flexible movement in the X and Y axles when lifting.

#### Runway track

Stationary aluminium profiles on which a hoist or other lifting equipment travels. A runway usually consists of two runway profiles, but may also be a single track runway or a triple track runway solution.

#### Suspension

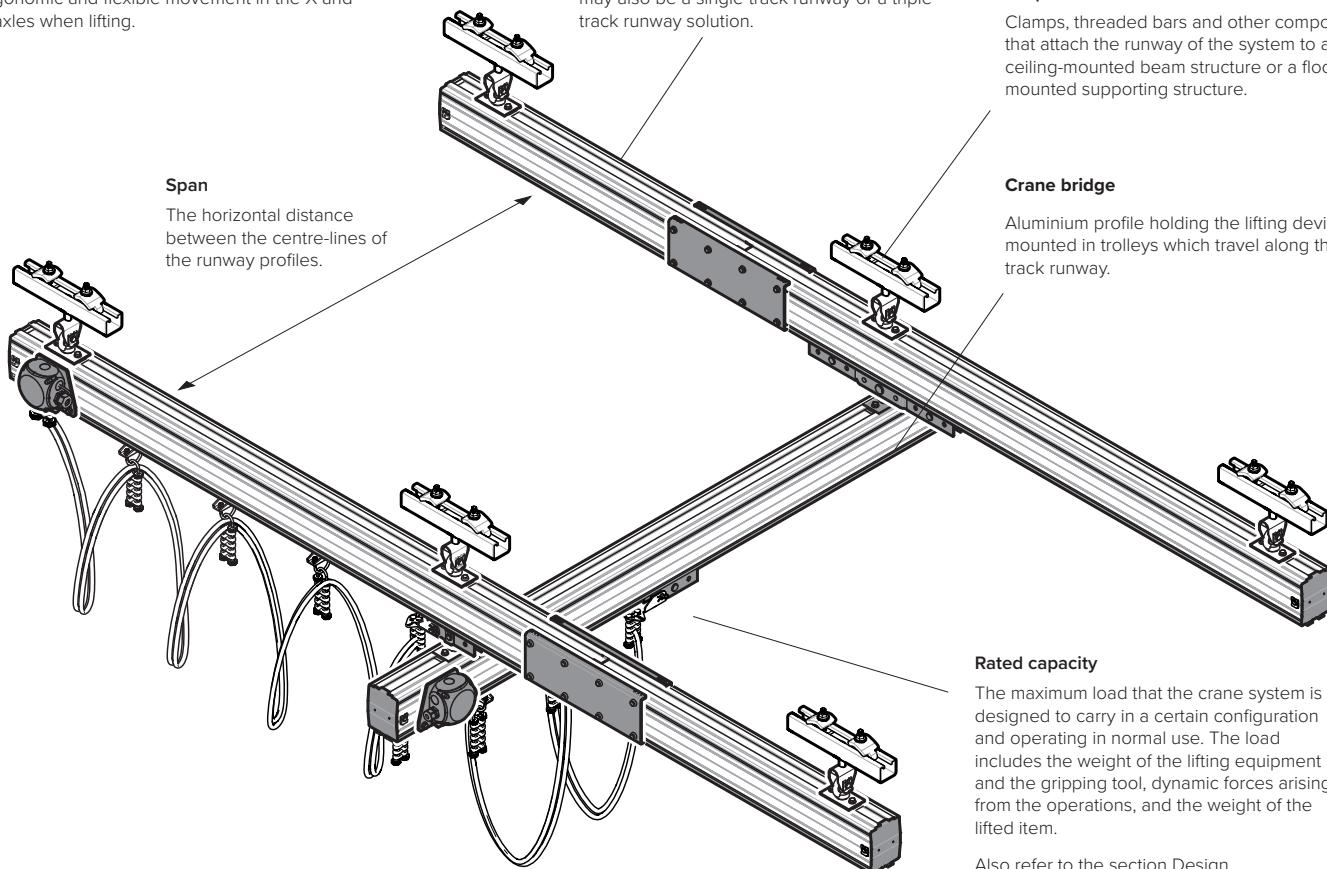

Clamps, threaded bars and other components that attach the runway of the system to a ceiling-mounted beam structure or a floor-mounted supporting structure.

#### Crane bridge

Aluminium profile holding the lifting device, mounted in trolleys which travel along the track runway.

#### Span

The horizontal distance between the centre-lines of the runway profiles.

#### Rated capacity

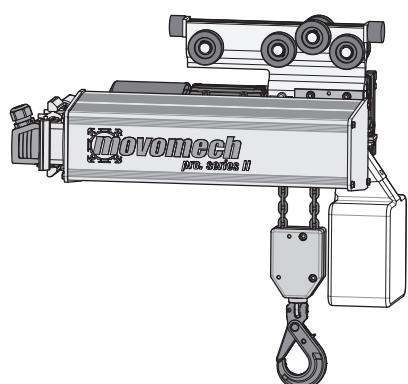

The maximum load that the crane system is designed to carry in a certain configuration and operating in normal use. The load includes the weight of the lifting equipment and the gripping tool, dynamic forces arising from the operations, and the weight of the lifted item.

Also refer to the section Design.

*An example of a simple ceiling-mounted overhead crane system for e.g. lifting with an electric chain hoist.*

#### Lifting equipment

The equipment for lifting and lowering a load.

## GENERAL CHARACTERISTICS

### Mechrail™ aluminium crane system

Mechrail™ is a modular lightweight overhead crane system of light aluminium profiles for manual or powered handling of goods, designed to be used together with a number of different lifting devices.

The lightweight overhead crane system is designed to be attached to a ceiling-mounted beam structure or a floor-mounted supporting structure. The system must be dimensioned for the forces acting on it when in operation, and this must be verified before commissioning the overhead crane system.

Because of the hanging design, most configurations will only have downward-going forces on the supporting structure. An exception when upward-going forces are created, is if e.g. a torque absorbing load manipulator is mounted close to a runway.

### Technical regulations

The Movomech range of products are designed according to the state of the art for technical equipment, and meets the requirements in the applicable European Norms and Regulations. The Standards and Directives that apply to the product are stated in the Declaration of Conformity or the Manufacturers declaration supplied with the product.

### Safety precautions

The documentation provides appropriate instructions for the user to ensure safe operation and simple maintenance.

All personnel that transport, install, put into use, operate, maintain and repair the Movomech equipment and attached equipment must have read and understood:

- the Operating Instructions,
- the Safety Instructions, and
- the Safety Precautions in the various sections.

To avoid erroneous use and to ensure uninterrupted operation with our products, these Operating Instructions must always be available for the user/operator.

### Installing the crane system

The overhead crane system must be installed using authentic components supplied or approved by Movomech. Components from other sources may carry a risk for the equipment or the personnel and voids any warranty claim.

When installing the equipment all safety and installing instructions in the manual must be observed and the installation work must be documented. During the installation work the work area must be closed for unauthorized persons.

The installation work requires skilled personnel and suitable tools in order to ensure safe and reliable operation. We recommend that the installation work is only performed by authorized personnel or an experienced service technician, authorized by the manufacturer.

### Preventive maintenance

The overhead crane system is designed using modular components requiring minimal maintenance. As a general rule, the tightening torques of the screw joints must be checked regularly, and also the state of the safety equipment and wear parts. The intervals for preventive maintenance depend on the actual usage of the system, but should be performed at least annually.

See the product manual for further information.

## MATERIAL PROPERTIES

### Crane system profiles

The Mechrail crane system profiles are made of anodized aluminium and require no maintenance. They are manufactured in EN-AW 6063 T6 aluminium alloy according to SS-EN 755-2:2016, anodized colour C0 (natural).

### Accessory range

A large part of the components in the Mechrail range are coated by galvanizing or anodizing, which makes them better resistant against wear and tear than painted components.

## TEMPERATURE AND ENVIRONMENTAL CONDITIONS

### Temperature and environmental limitations

This product is designed to be used indoors in typical industrial environments such as in the automotive industry production and general manufacturing.

Temperature range +5 to +40 °C.

Atmospheric corrosion category C2.

Noise level < 70dB (A).

### ATEX

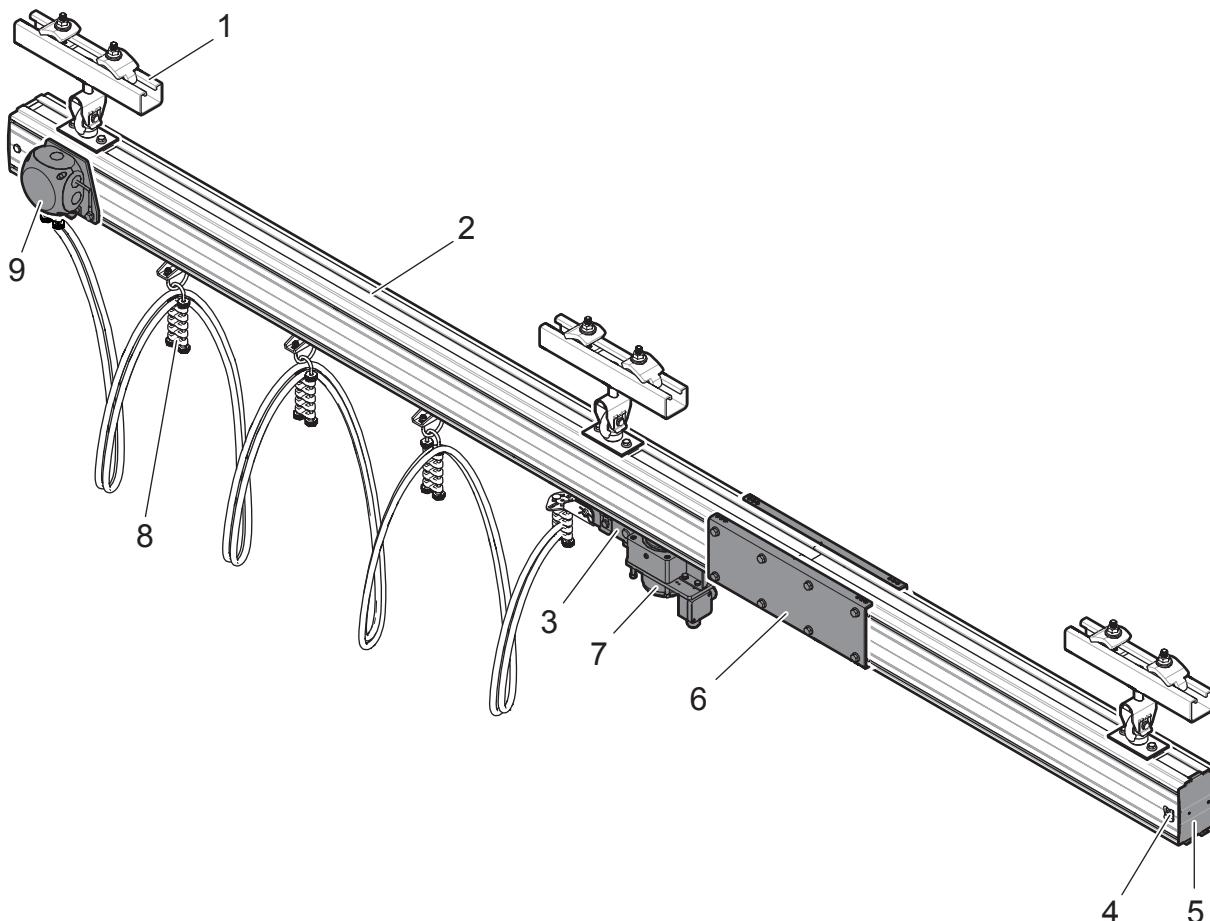

This product is not ATEX classified according to the EU directive for equipment in explosive environments.

## CONFIGURATION EXAMPLE

## Example 1: Single runway

Single runway - flexible suspension

Media supply - cable trolleys

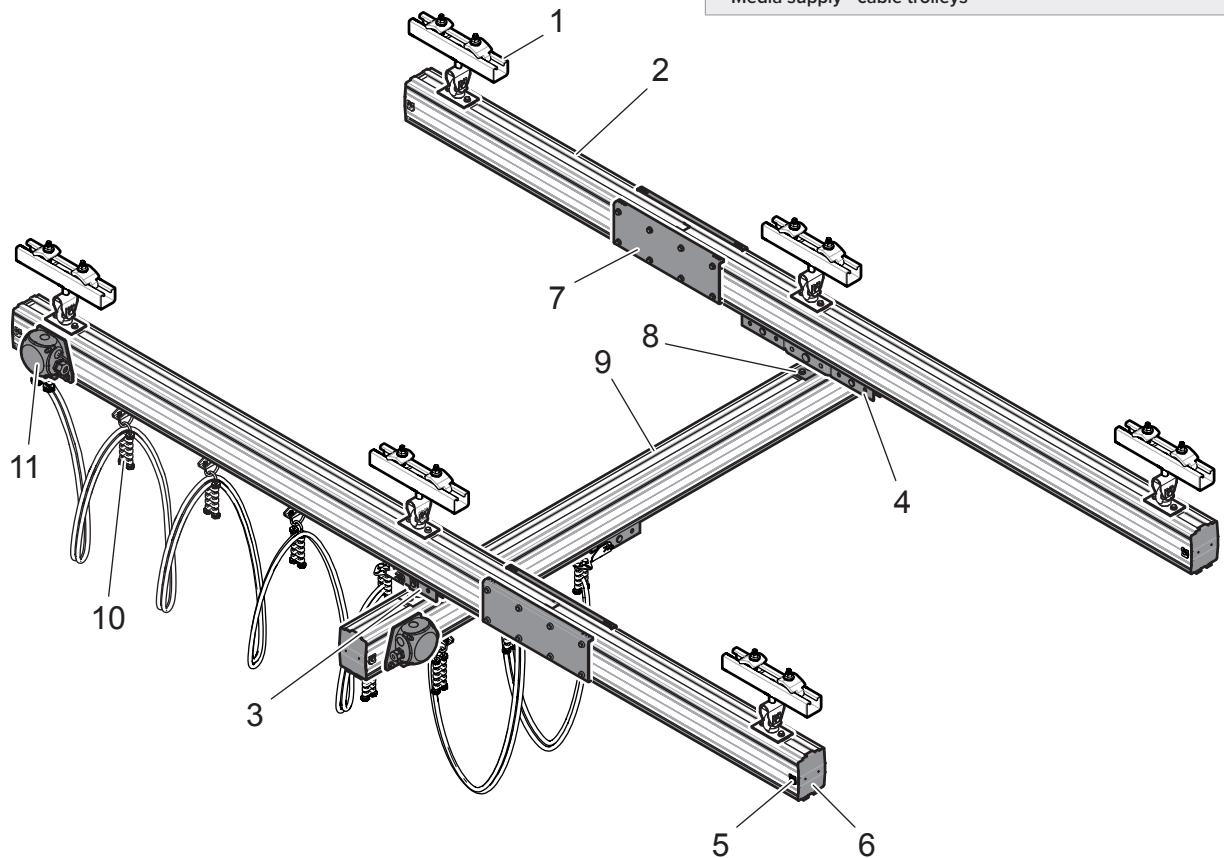

Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(A) Short	page 32	
2	Profile, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Joint set	AHB140	page 43	
7	Brake	(A) Electric 230 V	page 56	
8	Media supply	Cable trolley	page 61	
9	Connecting unit	AHB140/190	page 84	

A single runway is used in applications that only require movement in one direction.

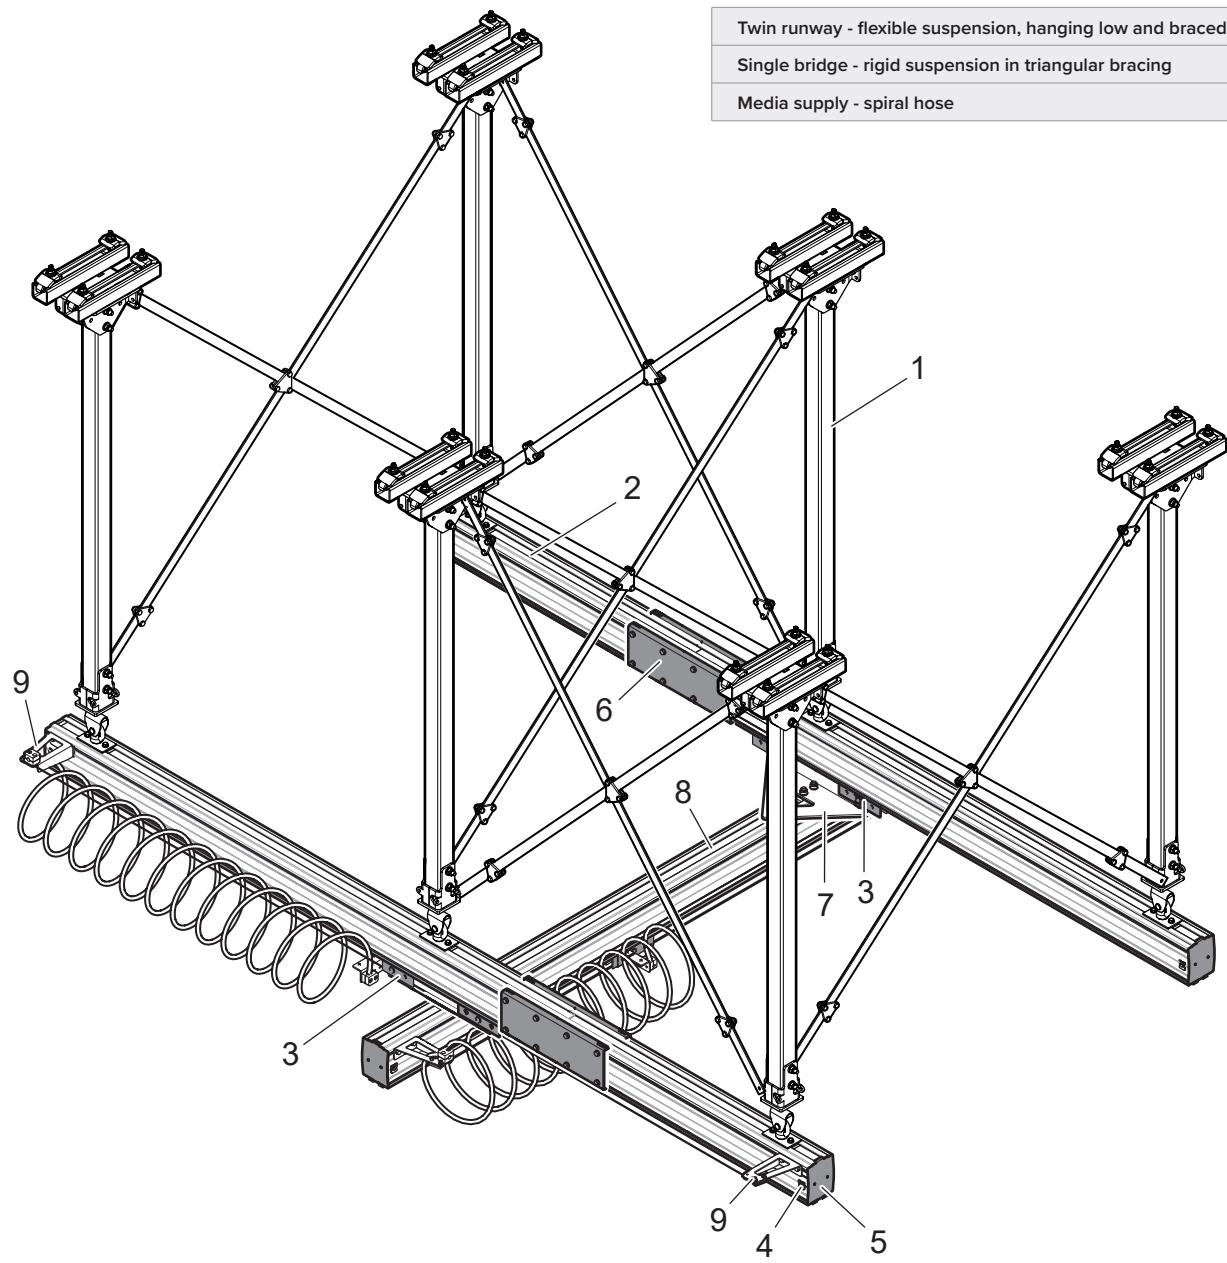

**Example 2: Single bridge**

Twin runway - flexible suspension  
 Single bridge - flexible suspension  
 Media supply - cable trolleys

Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(A) Short	page 32	
2	Profile, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	Trolley	(B) Double trolley	page 38	
5	End stop	AHB140/190	page 40	
6	End cover	AHB140	page 42	
7	Joint set	AHB140	page 43	
8	Bridge suspension	Crane girder suspension (A)	page 44	
9	Profile, bridge	AHB140	page 28	
10	Media supply	Cable trolley	page 61	
11	Connecting unit	AHB140/190	page 84	

Twin runway with single bridge suspended in a crane girder suspension (A) is the most common way to configure a rail system when using non-torque absorbing lifters.

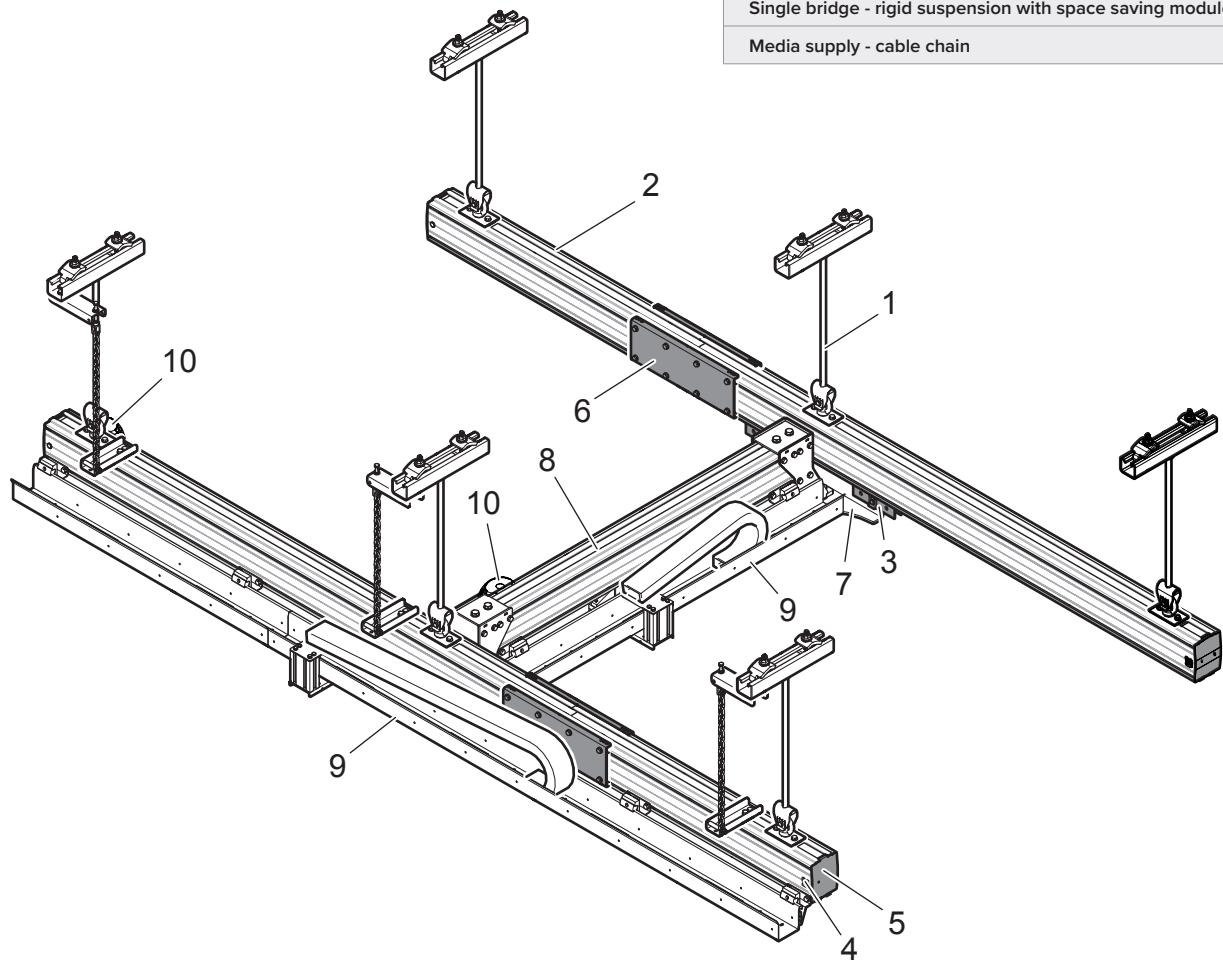

**Example 3: Long suspensions and triangular bracing**

Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(C) Long	page 32	
2	Profile, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Joint set	AHB140	page 43	
7	Bridge suspension	Triangular bracing	page 46	
8	Profile, bridge	AHB140	page 28	
9	Media supply	Spiral hose	page 59	

Suspension (C) Long is used when the overhead beams are higher up than necessary, and the crane system needs to be hanging low. Triangular bracing provides a rigid mounting that only allows movement in the direction of the runway profile.

**Example 4: Single bridge with space saving module**

Twin runway - flexible suspension, hanging low  
 Single bridge - rigid suspension with space saving module  
 Media supply - cable chain

Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(B) Intermediate	page 32	
2	Profile, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Joint set	AHB140	page 43	
7	Bridge suspension	Space saving module	page 47	
8	Profile, bridge	AHB140	page 28	
9	Media supply	Cable chain	page 76	
10	Connecting unit	AHB140/190	page 84	

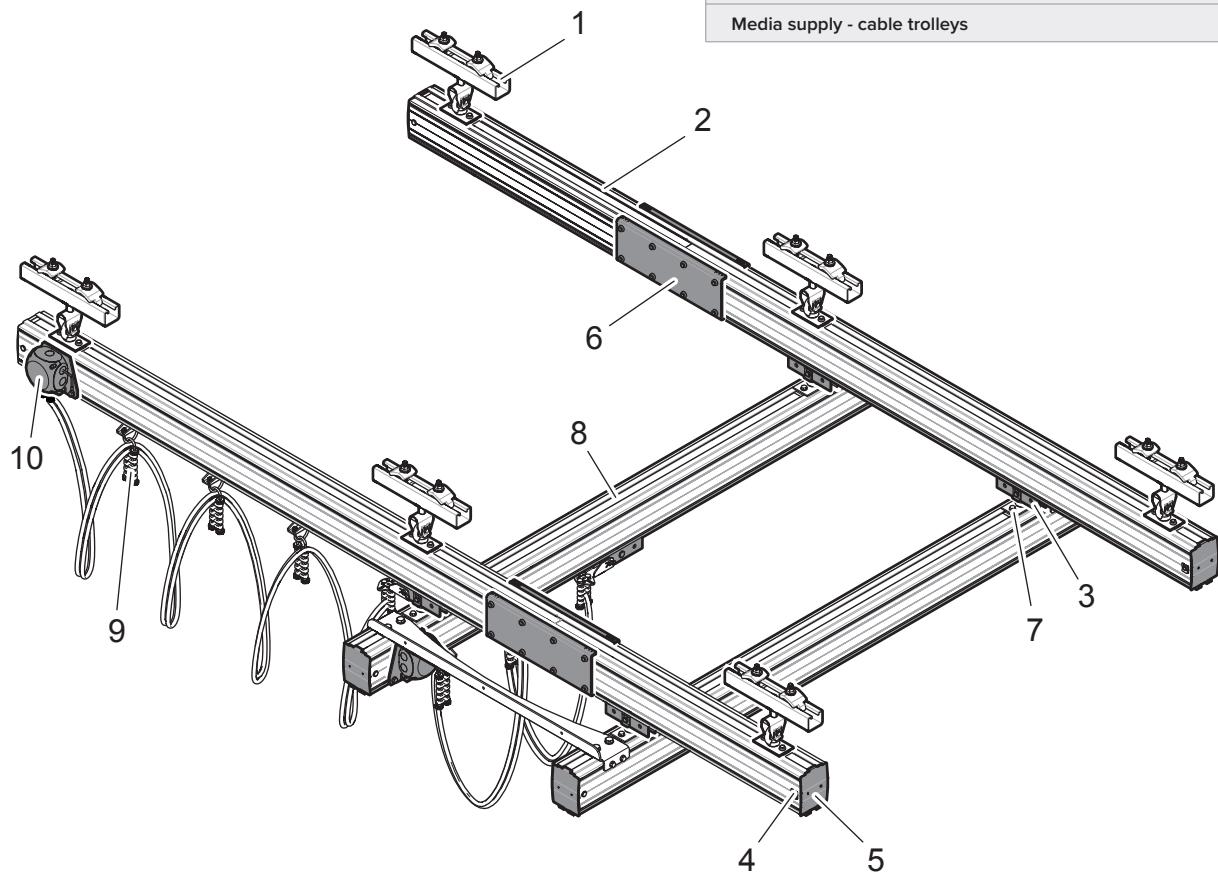

A space saving module in the bridge minimizes the total height of the crane system and is used in buildings with low ceiling height.

**Example 5: Twin bridge**

Twin runway - flexible suspension

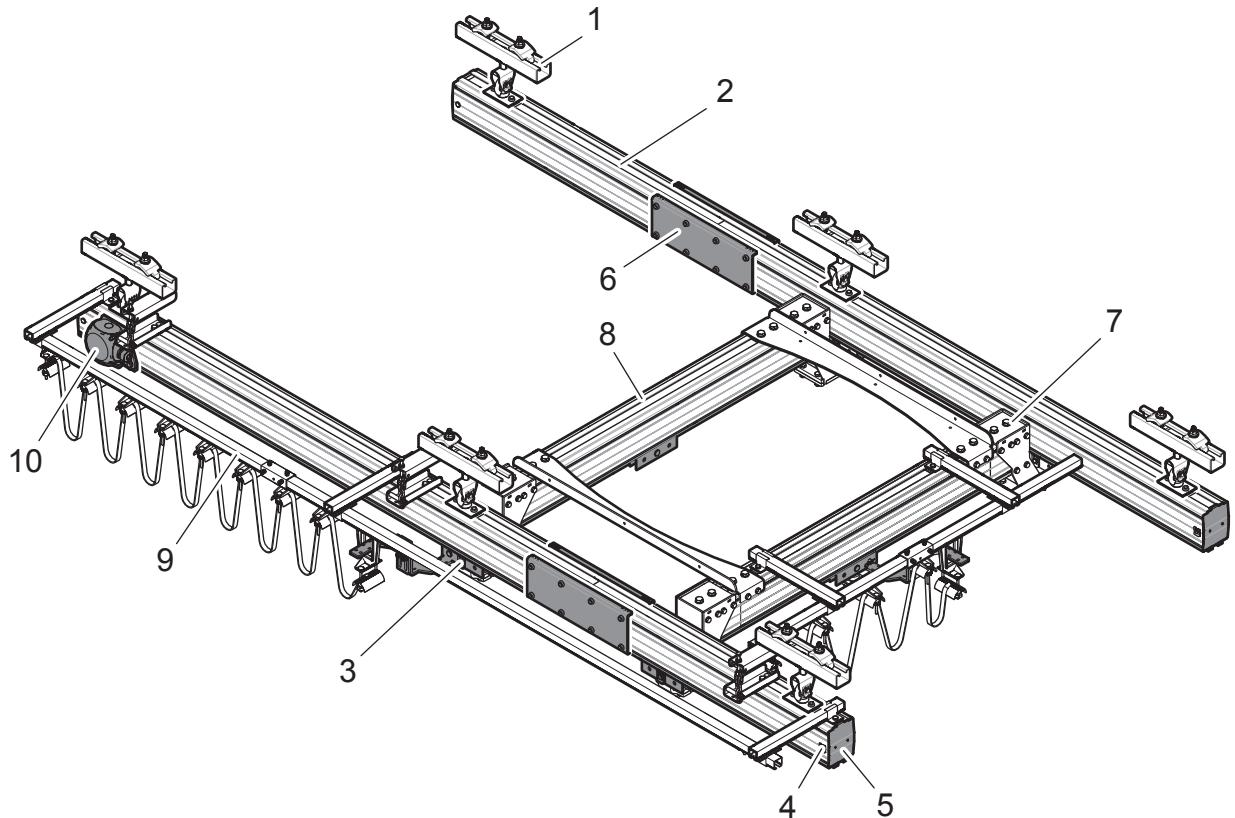

Twin bridge - flexible suspension

Media supply - cable trolleys

Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(A) Short	page 32	
2	Profile, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Joint set	AHB140	page 43	
7	Bridge suspension	Crane girder suspension (A)	page 44	
8	Profile, bridge	AHB140	page 28	
9	Media supply	Cable trolley	page 61	
10	Connecting unit	AHB140/190	page 84	

Twin runway with twin bridge suspended in crane girder suspension (A) is the most common way to configure a crane system when using torque absorbing lifters.

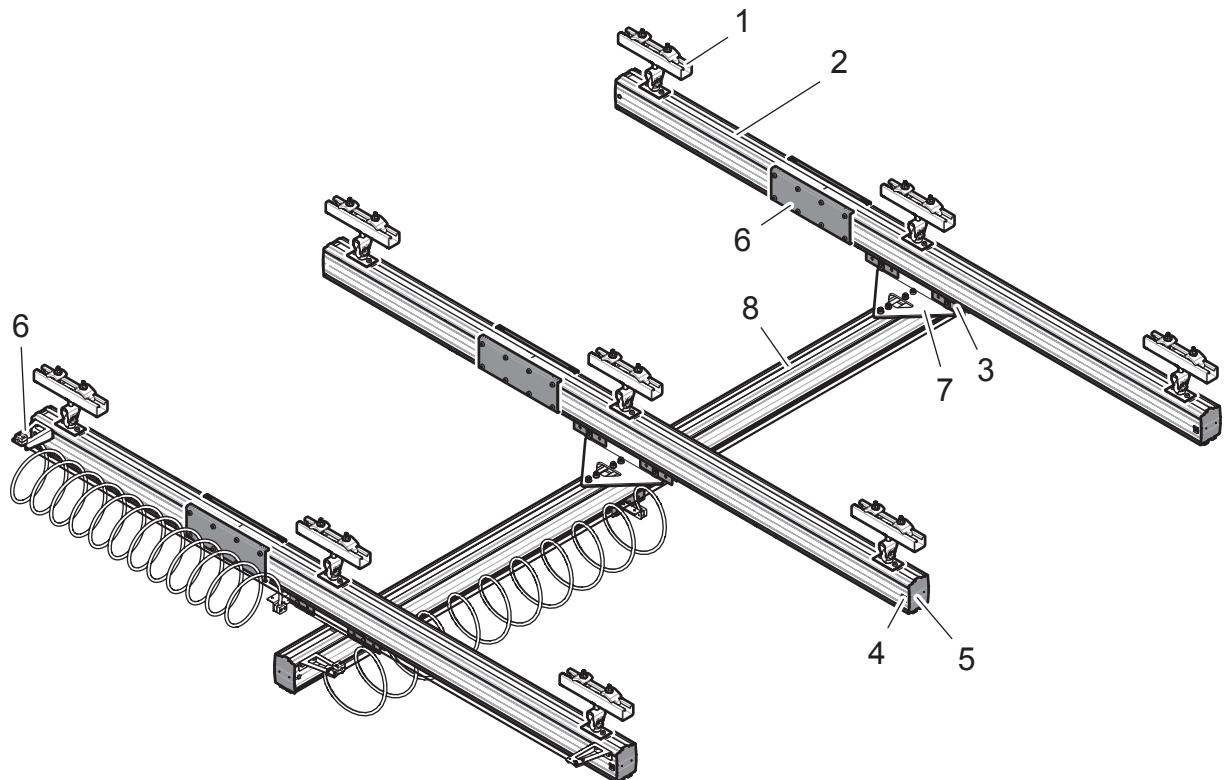

**Example 6: Twin bridge with space saving module**
**Twin runway - flexible suspension**
**Twin bridge - rigid suspension with space saving module**
**Media supply - cable trolleys in C-profile**

Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(A) Short	page 32	
2	Profile, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Joint set	AHB140	page 43	
7	Bridge suspension	Space saving module	page 47	
8	Profile, bridge	AHB140	page 28	
9	Media supply	Cable trolley in C-profile	page 68	
10	Connecting unit	AHB140/190	page 84	

A cable trolley in C-profile is used to be able to range over a longer work area, and to avoid cables and hoses hanging down in the work area.

**Example 7: Triple runway**

Triple runway - flexible suspension  
 Single bridge - rigid suspension in triangular bracing  
 Media supply - spiral hose

Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(A) Short	page 32	
2	Profile, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Joint set	AHB140	page 43	
7	Bridge suspension	Triangular bracing	page 46	
8	Profile, bridge	AHB140	page 28	
9	Media supply	Spiral hose	page 59	

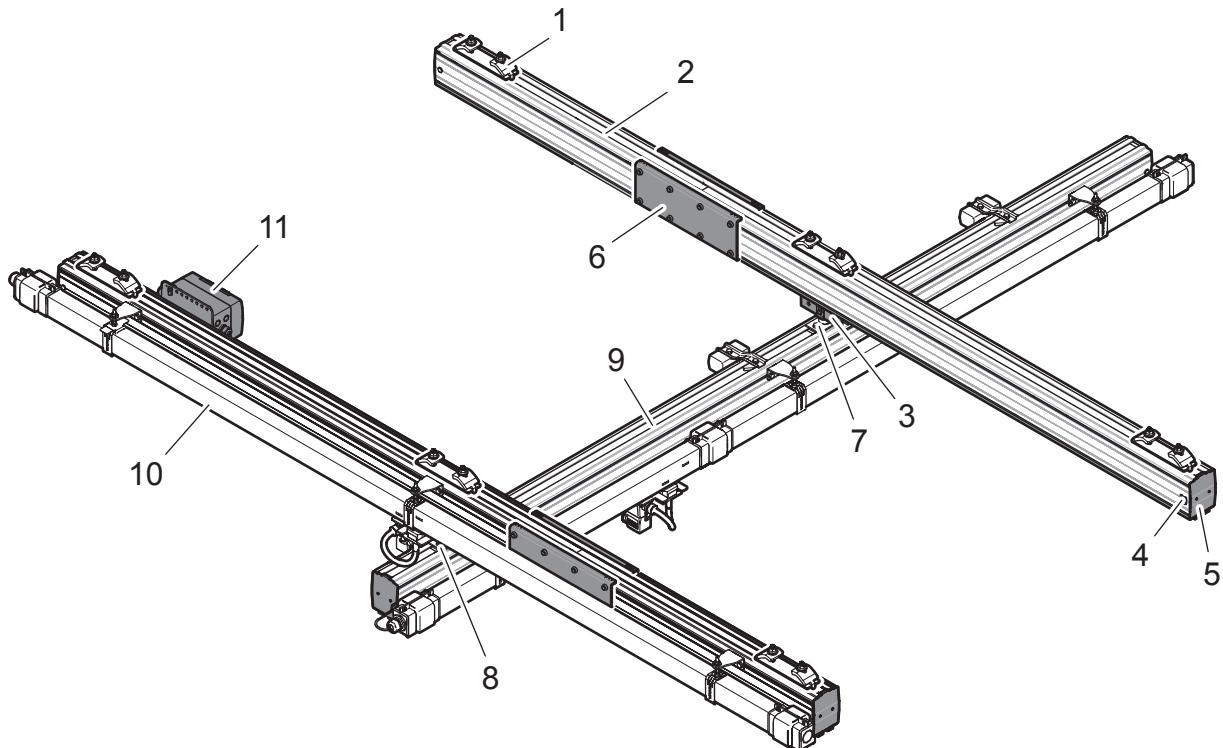

Triple runway system makes it possible for the bridge to have a larger span.

**Example 8: Single bridge with overhang**

Twin runway - rigid suspension, tight

Single bridge - flexible suspension

Media supply - power rail

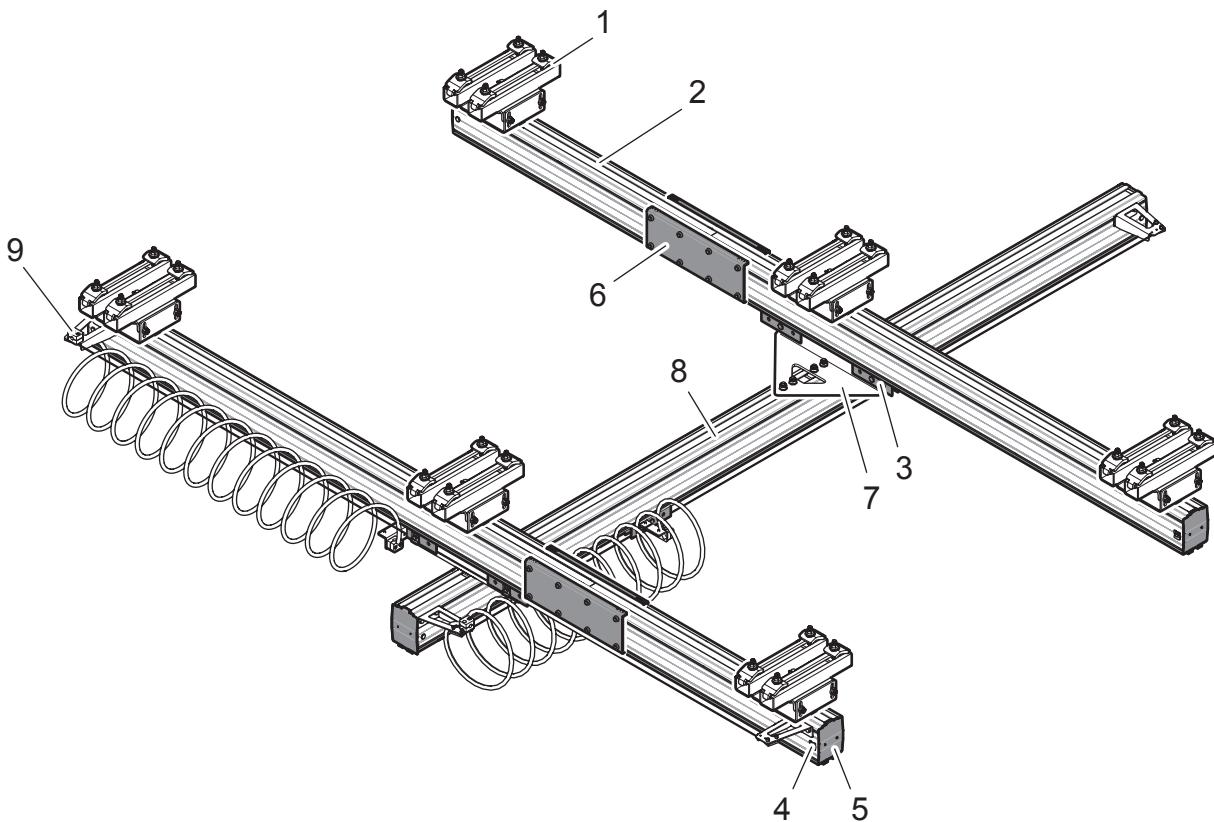

Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(D) Tight	page 32	
2	Profile, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Joint set	AHB140	page 43	
7	Bridge suspension	Crane girder suspension (A)	page 44	
8	Bridge suspension	Crane girder suspension (C) - ball joint	page 44	For forces directed upwards
9	Profile, bridge	AHB140	page 28	
10	Media supply	Power rail	page 79	
11	Connecting unit	Fuse box AHB140/190	page 84	

The preferred solution when supplying power to several bridges.

**Example 9: Tight single bridge with overhang and triangular bracing**

Twin runway - adjustable rigid suspension
Single bridge - rigid suspension in triangular bracing
Media supply - spiral hose

Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(F) Tight, adjustable	page 32	For forces directed upwards
2	Profile, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Joint set	AHB140	page 43	
7	Bridge suspension	Triangular bracing	page 47	For forces directed upwards
8	Profile, bridge	AHB140	page 28	
9	Media supply	Spiral hose	page 59	

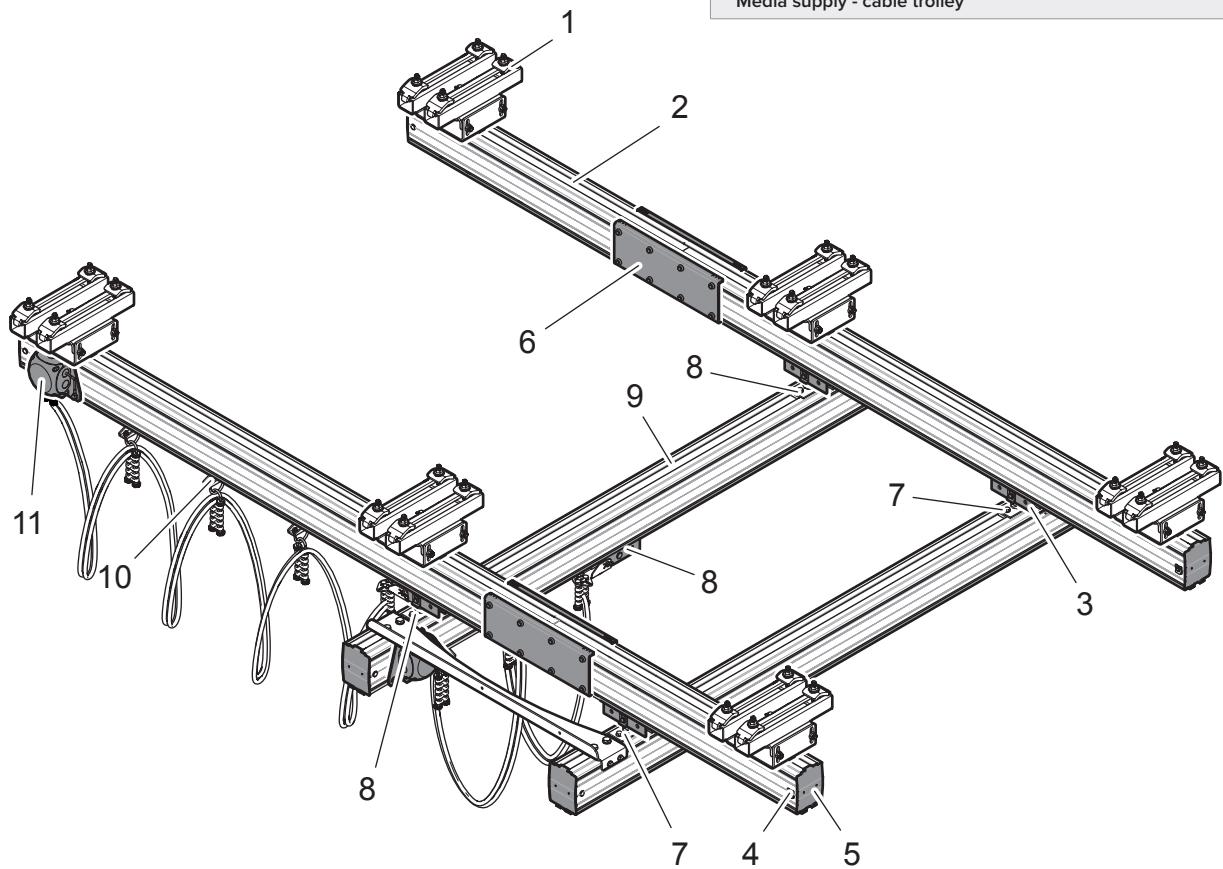

Tight, adjustable suspension (F) is used for systems that have a single bridge, subject to forces directed upwards, e.g. when the bridge has a major part hanging outside the runway, or in case of a telescoping crane.

## Example 10: Tight twin bridge

Twin runway - adjustable rigid suspension

Twin bridge - rigid suspension

Media supply - cable trolley

Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(F) Tight, adjustable	page 32	For forces directed upwards
2	Profile, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Joint set	AHB140	page 43	
7	Bridge suspension	Crane girder suspension (C)	page 44	For forces directed upwards
8	Bridge suspension	Crane girder suspension (A)	page 44	
9	Profile, bridge	AHB140	page 28	
10	Media supply	Cable trolley	page 61	
11	Connecting unit	(C) Round / round	page 84	

Tight, adjustable suspension (F) is used for systems that have a twin bridge subject to forces directed upwards, e.g. when using torque absorbing lifters, or in case of telescoping crane.

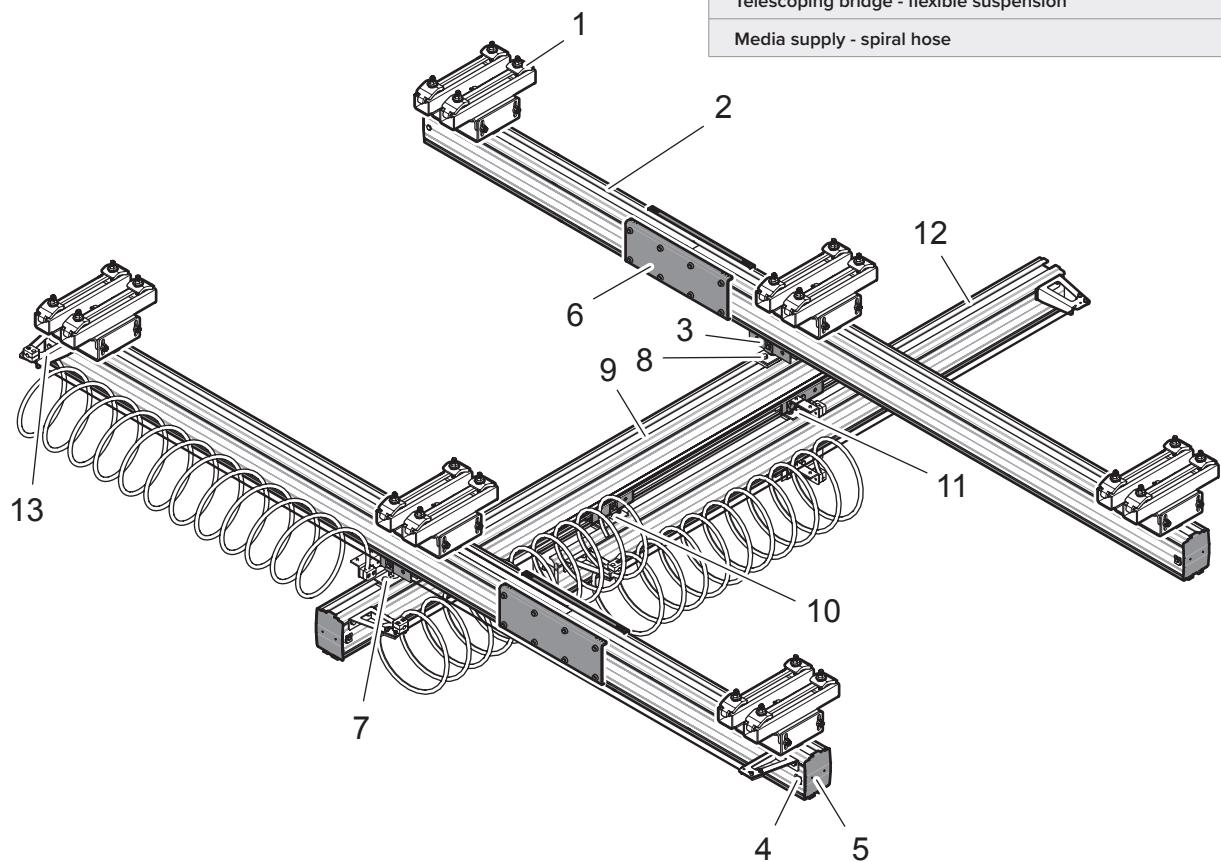

**Example 11: Telescoping single bridge**

Twin runway - adjustable rigid suspension

Single bridge - flexible suspension

Telescoping bridge - flexible suspension

Media supply - spiral hose

Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(F) Tight, adjustable	page 32	For forces directed upwards
2	Profile, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Joint set	AHB140	page 43	
7	Bridge suspension	Crane girder suspension (C) - ball joint	page 44	For forces directed upwards
8	Bridge suspension	Crane girder suspension (A)	page 44	
9	Profile, bridge	AHB140	page 28	
10	Suspension of telescoping bridge	Crane girder suspension (C)	page 44	For forces directed upwards
11	Suspension of telescoping bridge	Crane girder suspension (A)	page 44	
12	Profile, telescoping bridge	AHB140	page 28	
13	Media supply	Spiral hose	page 59	

A telescoping bridge is used e.g. when the crane rail needs to extend over an assembly line but to be out of the way as items move along the assembly line.

## SYSTEM DESIGN

### System design – EConfig

The Mechrail aluminium lightweight overhead crane system is a modern and modular system for loads up to 1000 kg.

It is vital that the system design is done correctly. Therefore it is necessary to read and understand the section System Design.

When deciding the size of the Mechrail lightweight overhead crane system, we recommend that you use the Movomech web based configuring tool - EConfig, at <http://www.movomech.com>.

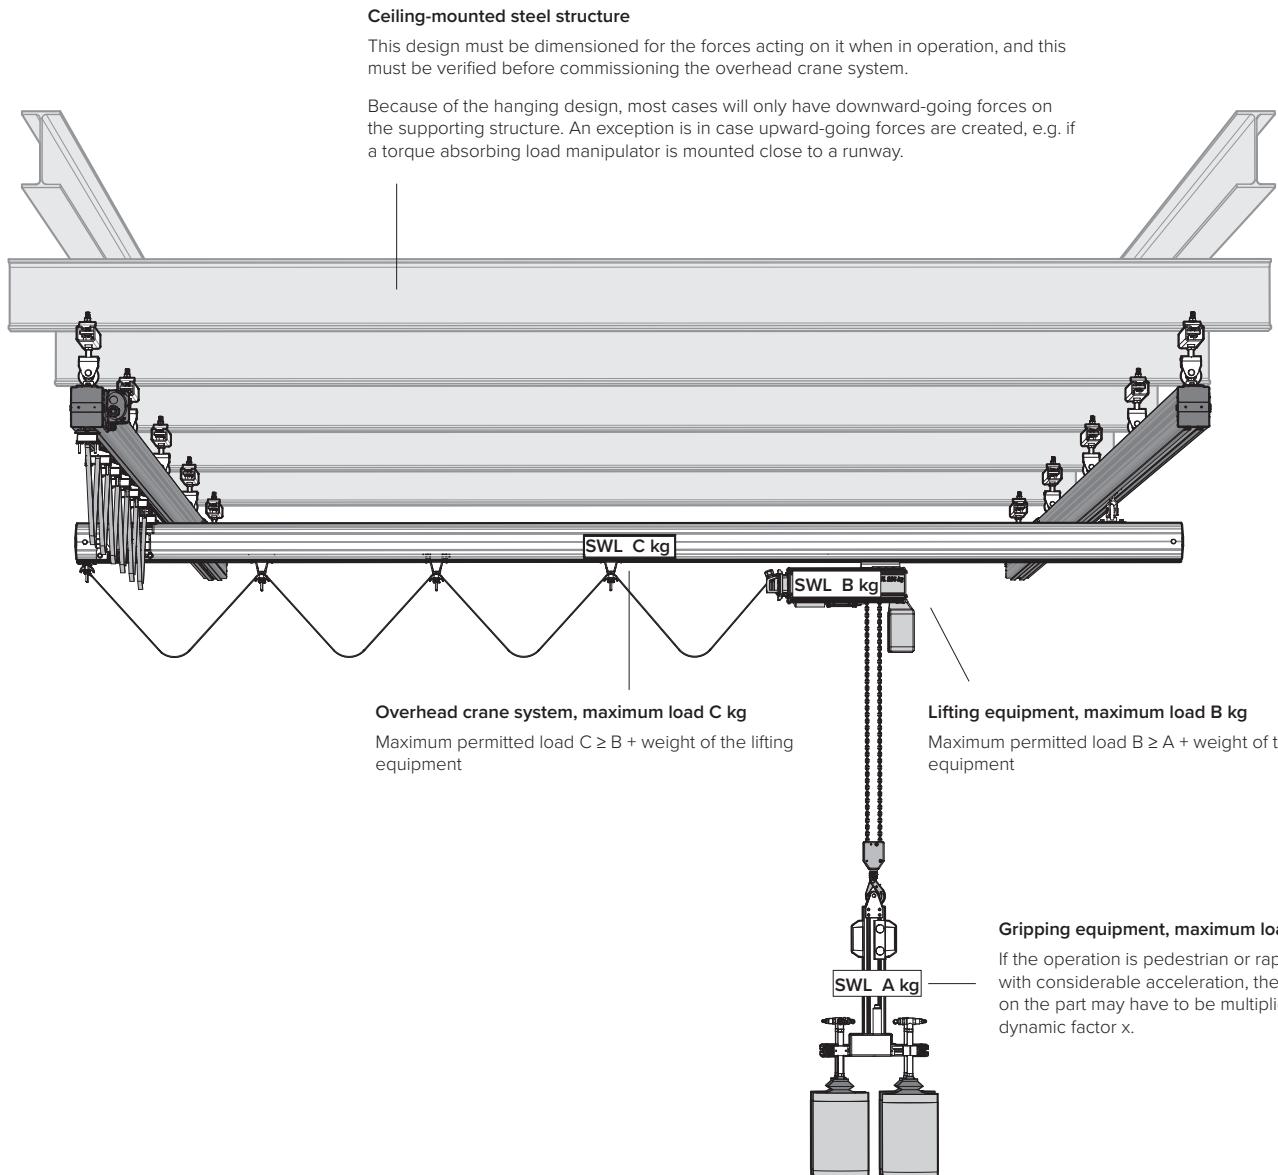

### Rated capacity

The rated capacity is the maximum load that the runway system is designed to carry in a certain configuration and in normal operation. The load includes the weight of the lifting equipment and the gripping tools, the weight of the lifted item, and dynamic forces arising from the operations.

When operating with torque absorbing lifting tools, telescoping bridges, etc., the toughest load case will be used for calculating the design.

### Marking with the maximum permitted load

The crane system has a modular design and may be equipped with various types of lifting equipment. The main rule is that any part of the handling solution must be clearly marked with its respective maximum permitted load, see example below.

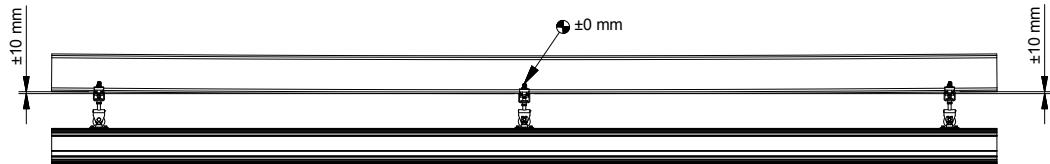

*Example of marking for maximum permitted load for each level respectively in a simple ceiling-mounted overhead crane system.*

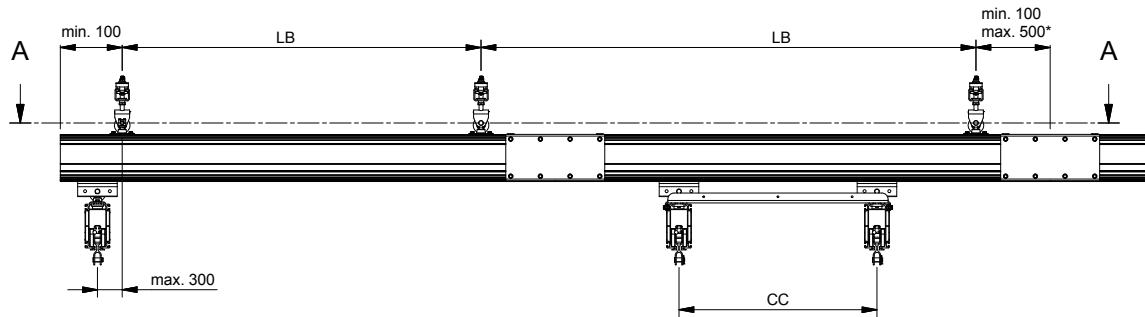

## TOLERANCE REQUIREMENTS AND INSTALLATION DIMENSIONS

### Horizontal level - overhead beams

The overhead beams mustn't exceed the tolerance  $\pm 10$  mm in the horizontal level.

### Installation dimensions

*LB = runway hanging distance*

*LT = bridge length*

*LS = bridge span*

*CC = distance centre to centre, twin bridge*

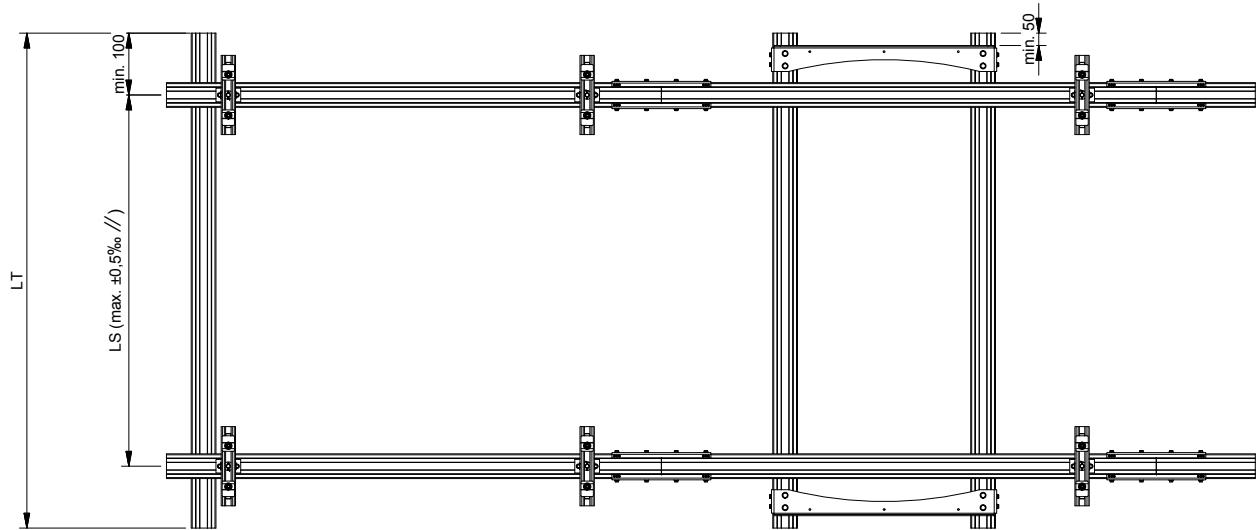

*X = component-dependant distance*

#### INFORMATION

Only one joint set may be fitted within the hanging distance LB and the distance from the suspension to the joint set may not exceed 500 mm. A joint set may only be used for bridges in three-string overhead crane systems. The above does not apply for AHB140/190 where the joint may be placed anywhere, but **the minimum distance from suspension to joint must always be 100 mm**.

### Parallelism - twin runway

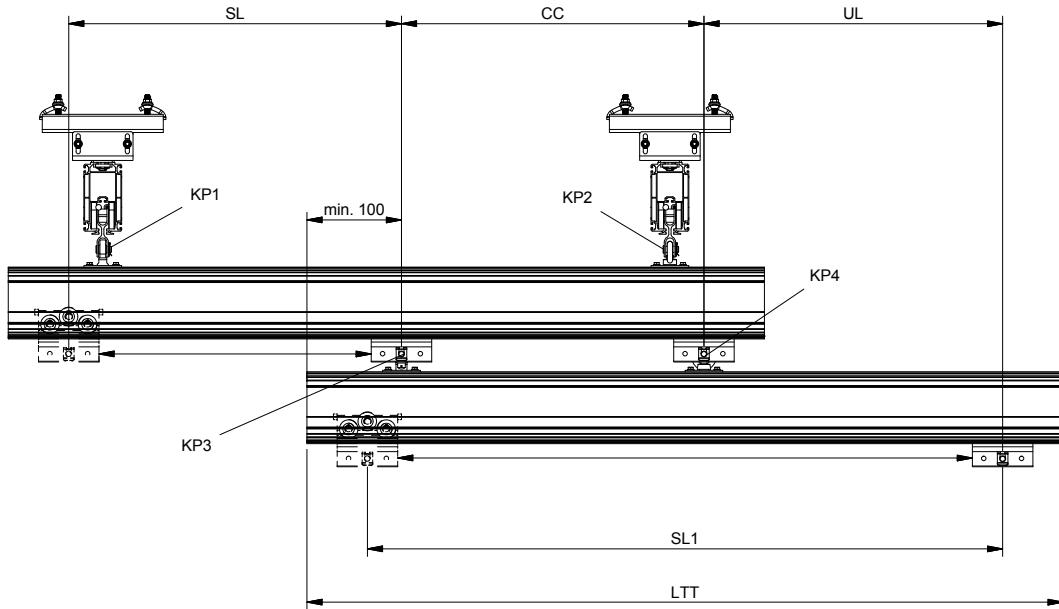

The suspensions for a twin runway cannot exceed the tolerance  $\pm 0.5\%$  for parallelism.

### Straightness - runways

Suspensions for a runway must be placed with less deviation than  $\pm 2$  mm from the intended path of the runway.

**Telescoping bridges****INFORMATION**

Contact Movomech if your application requires a telescoping bridge.

Suspensions D or F (see page 32) to be used with runway profiles.

Crane girder suspension C - ball joint to be used for KP1 single bridge.

Crane girder suspension C to be used for KP1 twin bridge.

Crane girder suspension A to be used for KP2.

Crane girder suspension C to be used for KP3

Crane girder suspension A to be used for KP4.

An inverted trolley may be required for KP1 and/or KP3.

A double trolley may be required for KP4.

*SL = bridge stroke*

*SL1 = telescoping crane stroke*

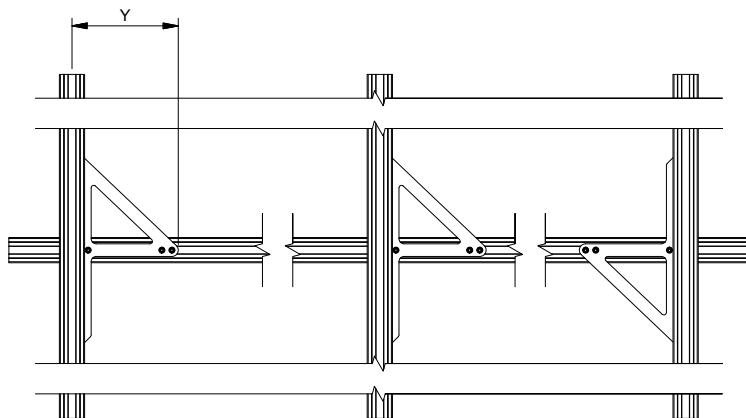

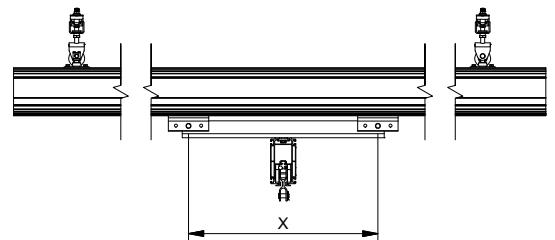

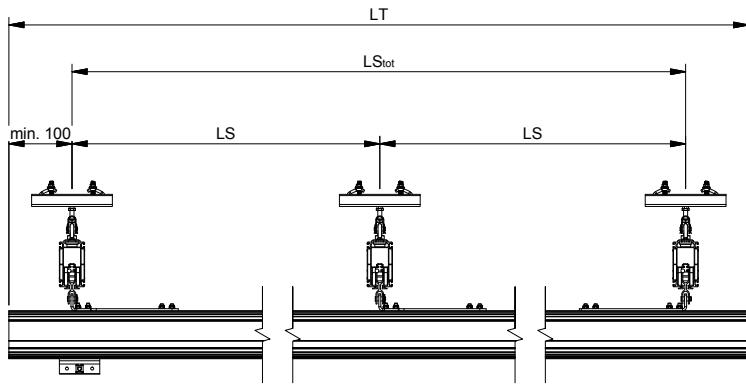

*CC = distance between suspensions*

*UL = overhang*

*LTT = length telescoping bridge*

*KP = connection point*

**Triple track system**

$LS$  = bridge span

$LS_{tot}$  = bridge total span

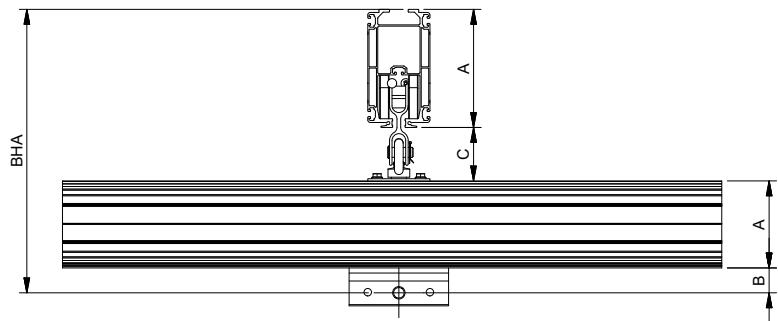

$LT$  = bridge length

$X$  = see "Triangular bracing" on page 46

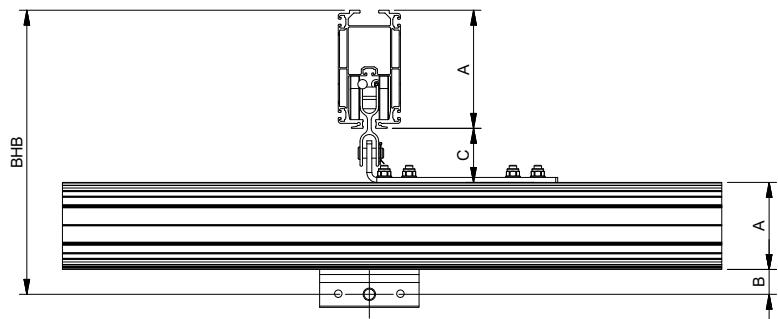

$Y$  = see "Triangular bracing" on page 46

## TOTAL INSTALLATION HEIGHT

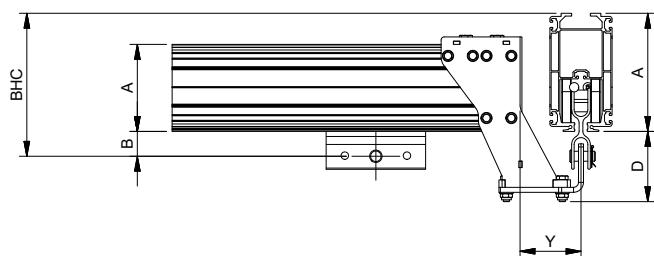

Crane girder suspension

Triangular bracing

Space saving module

## LOAD CHARTS

The load charts show the maximum spacing for the suspensions in a runway or bridge for a given load.

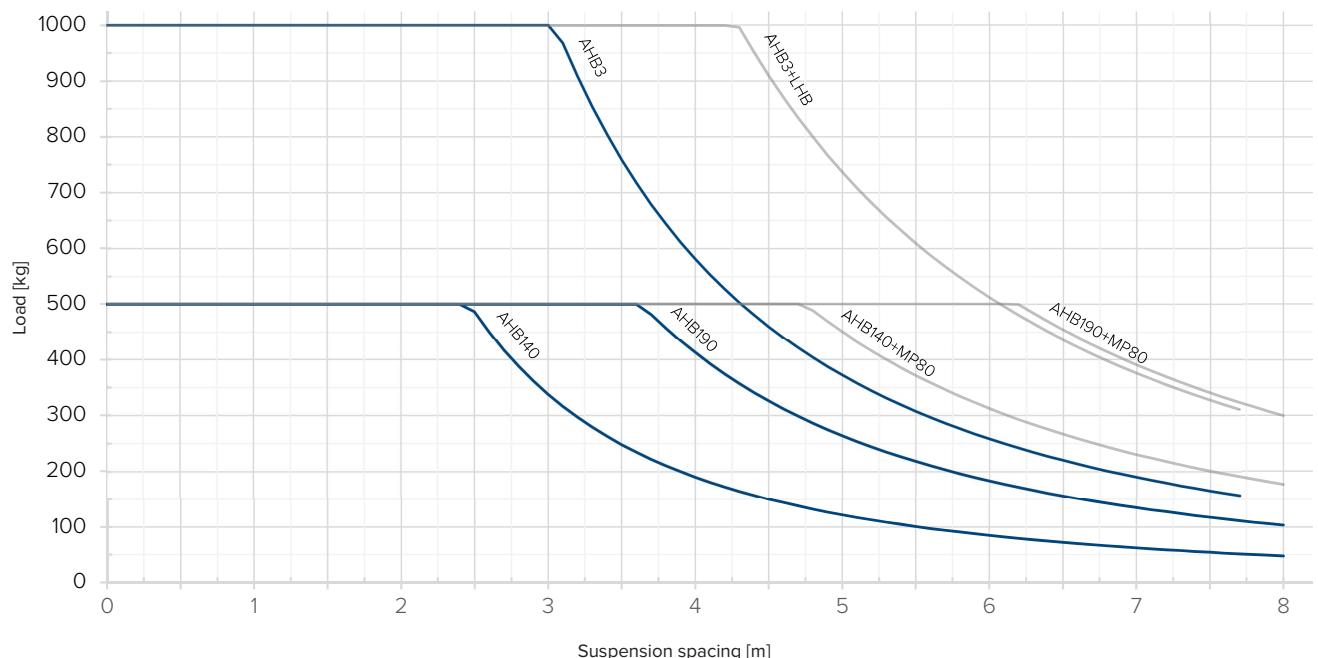

**Permitted deflection 1/500**

General use with all lifting applications with small to medium dynamic forces. Loads up to 500 kg.

**Permitted deflection 1/650**

General use with all lifting applications with large dynamic forces. Loads up to 1000 kg.

## CLASSIFICATION OF OPERATIONS

---

Permitted operation classes for Mechrail considering fatigue strength.

		Total number for cyclic stress (fatigue life)			
		N1	N2	N3	N4
Loadings		Intermittent, non-regular operations with long periods of non-activity  < 200 000	Regular operations with intermittent use  200 000 - 600 000	Regular operations with continuous use  600 000 - 2 000 000	Regular operations with heavy continuous use  > 2 000 000
S0	Very small changes of loads. Gentle operational use.	B1	B2	B3	B4
S1	Small changes of loads. Careful operational use.	B2	B3	B4	B5
S2	Average change of loads.	B3	B4	B5	B6
S3	Large changes of loads. Heavy operational use.	B4	B5	B6	B6

The following reduction factor must be observed when calculating the permitted capacity for trolleys and suspension components:

Trolley	B1	B2	B3	B4	B5	B6	
without any profile joints	1.0	1.0	1.0	1.0	0.8	0.7	
with profile joints	1.0	1.0	0.9	0.75	0.65	0.55	
							} x the capacity
Suspension component	B1	B2	B3	B4	B5	B6	
	1.0	1.0	1.0	1.0	0.8	0.7	
							} x the capacity

## SAFETY WIRE

---

### For suspension

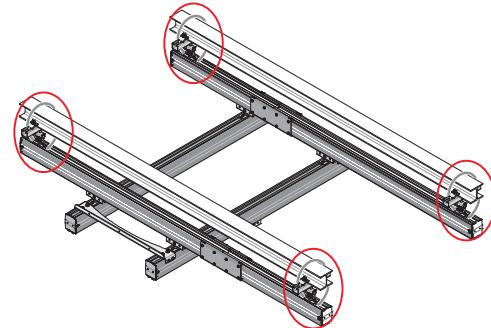

#### INFORMATION

Safety wires are used to secure the runway to the overhead beams.

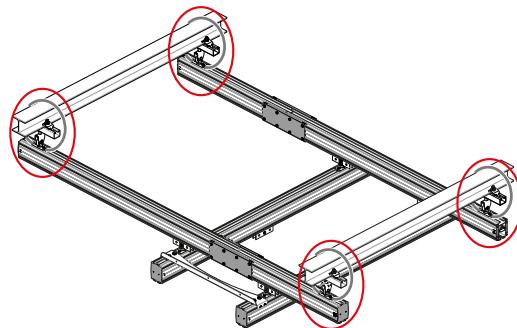

This is recommended when only two suspensions are holding a runway length, e.g. with a transverse steel beam where an added suspension cannot be fitted, as well as for cases with critical loads.

The length of the wire is to be adapted to each case.

See also "Safety wire for suspensions" on page 37.

*Longitudinal steel beam, suspension safety wire fitted*

*Transverse steel beam, suspension safety wire fitted*

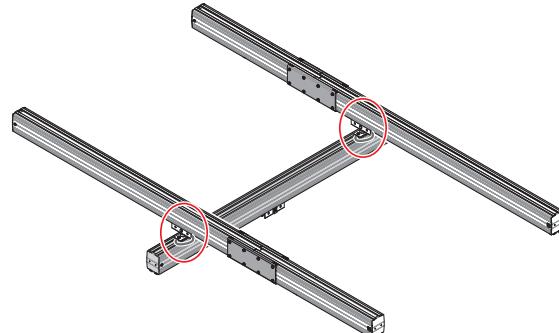

### For bridge

#### INFORMATION

A safety wire is used for a bridge to secure the crane girder suspension to the trolley.

Movomech recommends that these are used with single bridges.

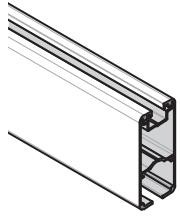

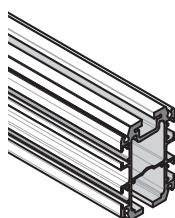

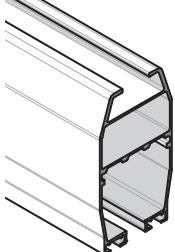

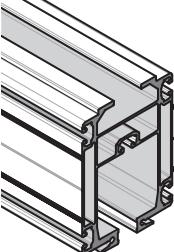

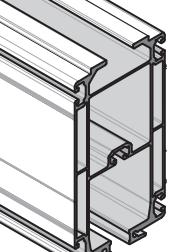

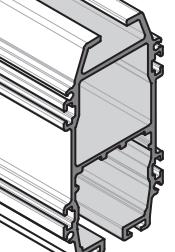

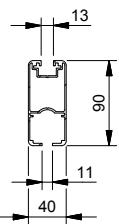

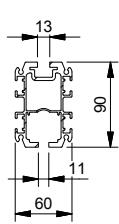

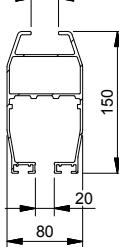

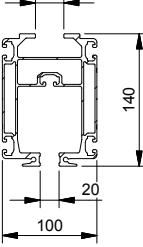

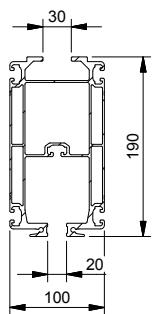

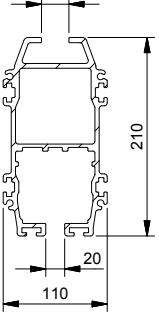

See also the section "Safety wire for bridges" on page 49.

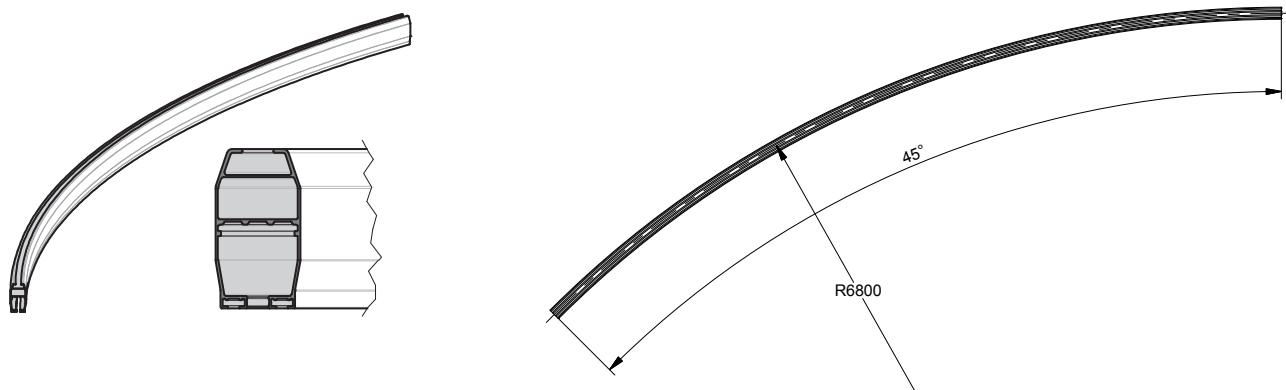

*Safety wire for bridge fitted*

Suspension cross brace (C)

#	m [kg]	Note
743918	21	

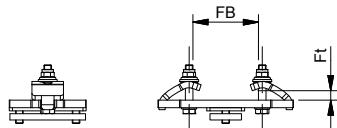

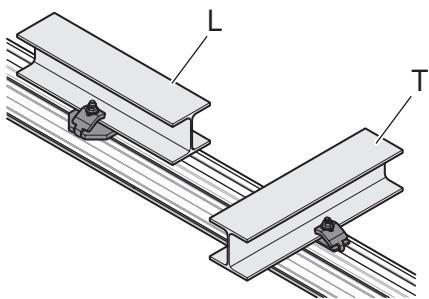

#### INFORMATION

A cross brace is recommended at  $Z > 1000$  mm and/or in case of large dynamic forces in the crane system.

Cross braces are supplied as kits to fit in between two suspensions. Max LB/LS = 7.5 m.

The cross braces may have to be cut to length when used together with a combination of a short LB/LS and a short Z.

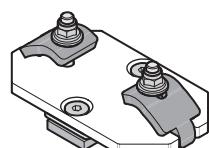

## (D) Tight

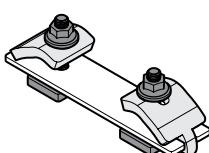

## INFORMATION

Cannot be used together with space saving module for bridge.

The overhead beams mustn't exceed the tolerance  $\pm 2$  mm in the horizontal level.

## SAFETY WIRE FOR BRIDGES

30s

(B) Single trolley, to be installed post commissioning

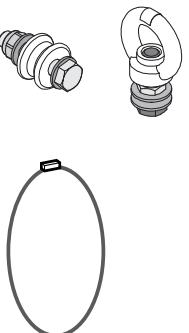

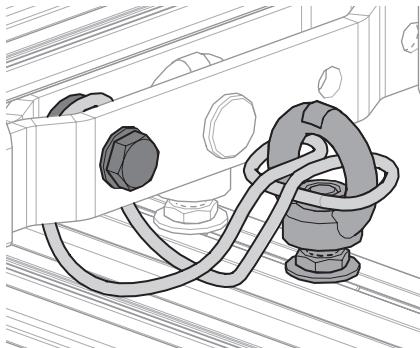

## INFORMATION

A safety wire is used for a bridge to secure the crane girder suspension to the trolley. Movomech recommends that these are used with single bridges.

Supplied as a kit. Secures one crane girder suspension.

See also the section "Safety wire" on page 27.

## SERVICE HATCHES

### INFORMATION

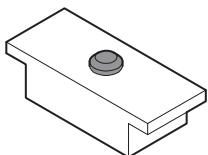

Service hatches are used with long runways, and permit the introduction/removal of trolleys and accessories at the middle of the runway instead of from the ends.

At least one suspension must be mounted above the service hatch.

#### INFORMATION

Travel limiters (C) and (D) are hydraulically damped.  
These are used for crane systems with large moving forces and in case there is a lot of operations at the end sections of the work area.

**ATTENTION!** Cable trolleys cannot pass (C)!

### SPIRAL HOSE

$SL$  = stroke [m]

$L1$  = hose compressed [m]

$L2$  = hose extended [m]

$VL$  = wire length [m]

$$L2 = (1.05 \times SL) + 0.15$$

$$L1 = SL / 20$$

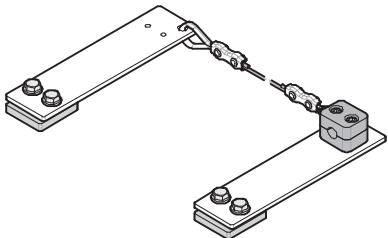

$$VL = L2 + 0.3$$

Sample calculation for  $SL = 8$  m:

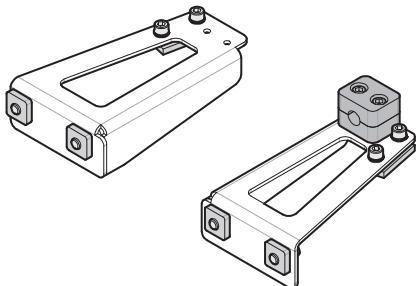

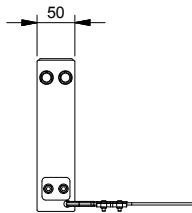

$$L2 = (1.05 \times 8) + 0.15 \quad 8.55 \text{ m}$$

$$L1 = 8 / 20 \quad 0.4 \text{ m}$$

$$VL = 8.55 + 0.3 \quad 8.85 \text{ m}$$

## CABLE TROLLEY FOR TRACK PROFILE

1. End bracket
2. Cable trolley
3. Strain relief
4. Wire clamp, fixed
5. Wire clamp, shackle
6. Hose / round cable

### INFORMATION

Cable trolleys should have travel limiters to prevent the crane system trolley colliding with the cable trolleys and creating unnecessary wear.

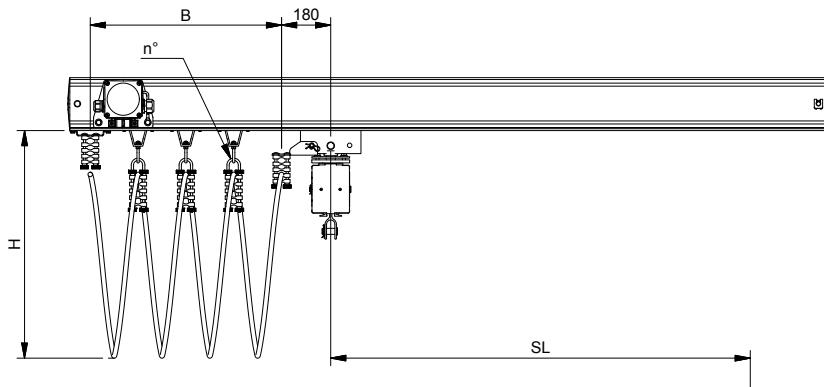

Cables and hoses are available by the meter.

There are four types of cable trolleys:

- (A) flat cable saddle, maximum width 15 mm
- (B) ball joint for hose and / or round cable Ø10 - 36 mm
- (C) strap for vacuum hose, max Ø90 mm
- (D) shackle for hose and / or round cable Ø8 - 22 mm

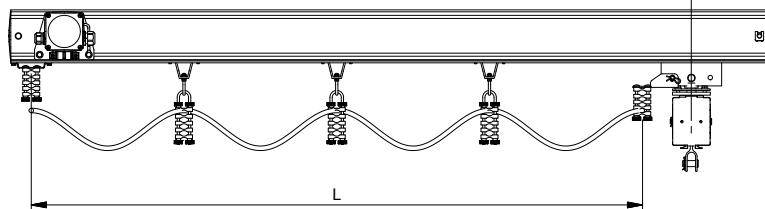

Wire clamps for (B) can rotate 360° in end fittings, cable trolleys and strain reliefs.

Wire clamps for (D) cannot rotate in end fittings and strain reliefs and is limited to 90° in cable trolleys which has the advantage of neither hose nor cable twisting.

$$\begin{aligned}
 SL &= \text{stroke [m]} \\
 B &= \text{buffer [m]} \\
 L &= \text{minimum length of cable/hose [m]} \\
 H &= \text{pendant [m]} \\
 n^\circ &= \text{number of cable trolleys}
 \end{aligned}$$

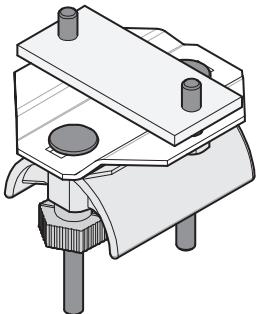

$$\begin{aligned}
 L &= SL_{max} \times 1.2 \\
 n^\circ &= (L / 2H) - 1 \\
 B_{min} &= (n^\circ + 1) \times 0.1 \\
 H_{max} &= 0.6
 \end{aligned}$$

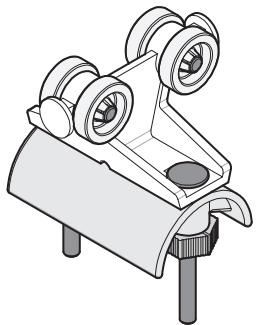

Sample calculation for  $SL = 12 \text{ m}$ ,  $H = 0.4 \text{ m}$ :

$$\begin{aligned}
 L2 &= 12 \times 1.2 & 14.4 \text{ m} \\
 n^\circ &= (14.4 / 0.8) - 1 & \text{qty } 17 \\
 B &= (17 + 1) \times 0.1 & 1.8 \text{ m}
 \end{aligned}$$

## INFORMATION

Cable trolleys should have travel limiters to prevent the crane system trolley colliding with the cable trolleys and creating unnecessary wear.

Cables and hoses are available by the meter.

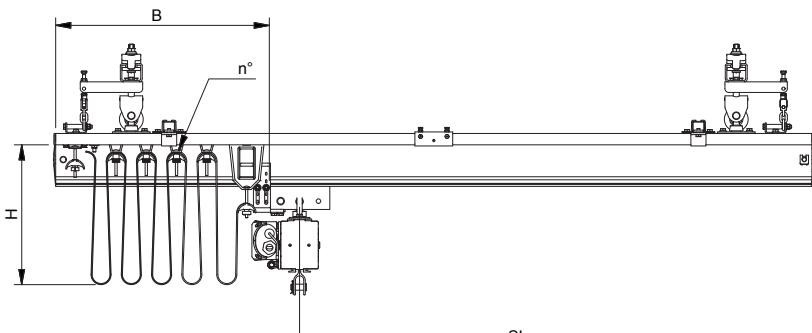

There are four types of cable trolleys:

- (A) flat cable saddle, maximum width 15 mm
- (B) ball joint for hose and / or round cable Ø10 - 36 mm
- (C) strap for vacuum hose, max Ø90 mm
- (D) shackle for hose and / or round cable Ø8 - 22 mm

Wire clamps for (B) can rotate 360° in end fittings, cable trolleys and strain reliefs.

Wire clamps for (D) cannot rotate in end fittings and strain reliefs and is limited to 90° in cable trolleys which has the advantage of neither hose nor cable twisting.

Cable trolley for C-rail is only applicable for 50s and 75s.

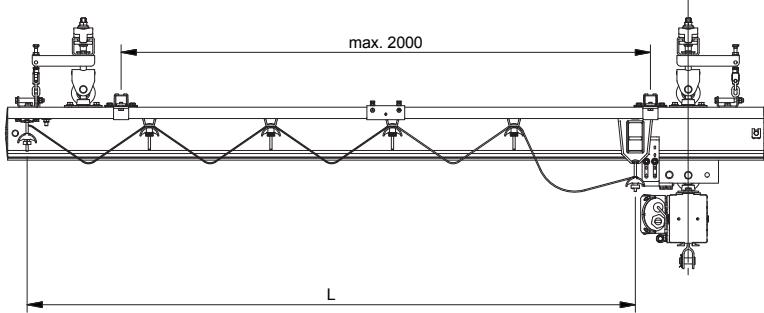

$SL = \text{stroke [m]}$

$B = \text{buffer [m]}$

$L = \text{minimum length of cable/hose [m]}$

$H = \text{pendant [m]}$

$n^\circ = \text{number of cable trolleys}$

$L = SL_{\max} \times 1.2$

$n^\circ = (L / 2H) - 1$

$B_{\min} = (n^\circ + 1) \times 0.1$

$H_{\max} = 0.6$

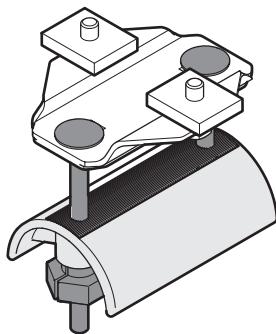

Sample calculation for  $SL = 12 \text{ m}$ ,  $H = 0.4 \text{ m}$ :

$$L_2 = 12 \times 1.2 \quad 14.4 \text{ m}$$

$$n^\circ = (14.4 / 0.8) - 1 \quad \text{qty } 17$$

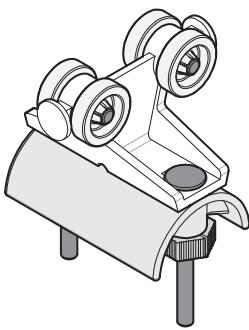

$$B = (17 + 1) \times 0.1 \quad 1.8 \text{ m}$$

## CABLE CHAIN

1. Grounding cable
2. Trough
3. Trough with slide strip
4. Trough bracket
5. Earth plate
6. Cable chain
7. Fitting
8. Cable trough support - upper
9. Cable trough support - lower
10. Chain
11. Follower arm

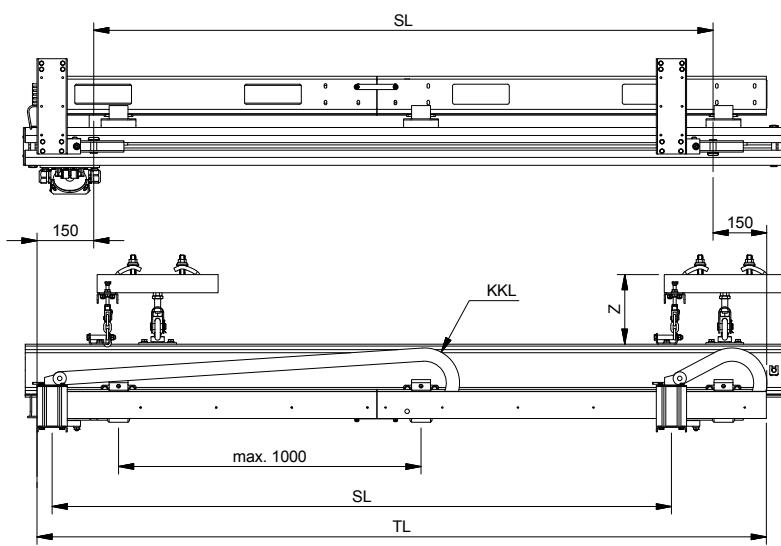

## INFORMATION

Fits only AHB 140 / 190.

A grounding cable is used for earthing and the equalization of potentials between crane / tracks, or between crane / track and earthed component.

If the connection is painted or coated in any way, the coating must be removed to create a satisfactory connection.

In case of  $SL > 4$  m, half of the troughs must be fitted with slide strips.

$SL$  = stroke [m]

$TL$  = trough length [m]

$KKL$  = cable chain length [m]

$TL = SL + 0.3$

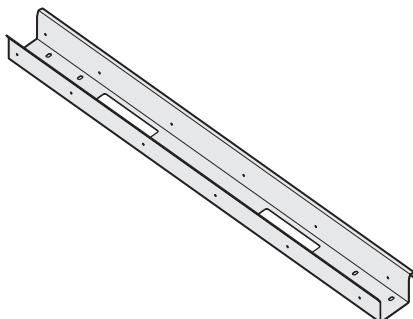

$KKL = (SL / 2) + 0.5$

Sample calculation for  $SL = 4$  m:

$TL = 4 + 0.3 \quad 4.3$  m

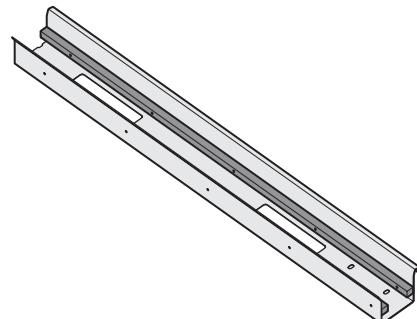

$KKL = (4 / 2) + 0.5 \quad 2.5$  m

Tray

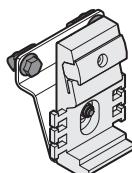

#	L [m]	m [kg]	Note

## POWER RAIL

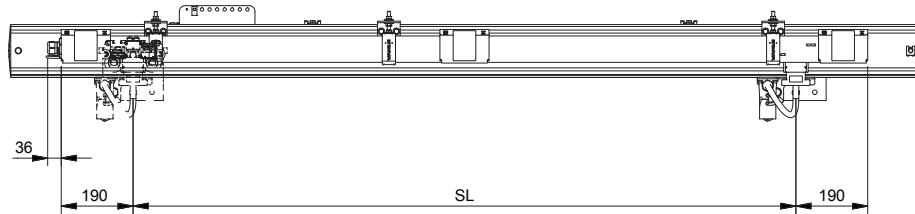

1. Power rail
2. Power takeoff
3. End feed
4. Joint set
5. End cover
6. Counterweight
7. Suspension, fixed
8. Suspension, sliding
9. Fuse box

## INFORMATION

The end feed must have a fixed suspension, the rest must be sliding. Each bridge must have its own fuse box if the bridge is supplied with power from a conductor rail in the track. A counterweight is used to prevent the rail from hanging askew.

**ATTENTION!** Electrical work is only permitted to be performed by a trained electrician.

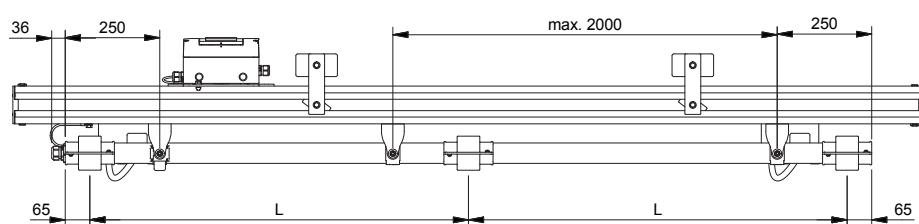

$$SL = \text{stroke [m]}$$

$$L = \text{power rail length [m]}$$

$$L_{\text{tot}} = \text{power rail total length [m]}$$

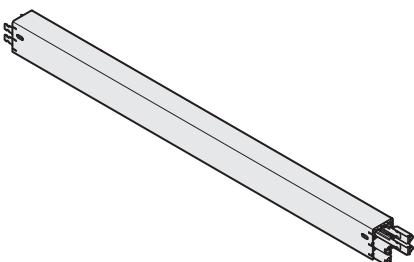

$$L_{\text{tot}} = SL + 0.2$$

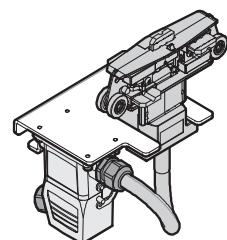

Sample calculation for  $SL = 5 \text{ m}$ :

$$L_{\text{tot}} = 5 + 0.2 \quad 5.2 \text{ m}$$

### INFORMATION

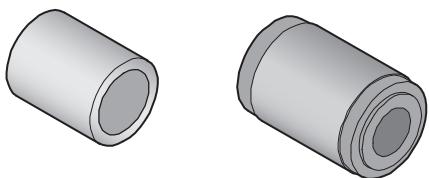

A: blowdown valve, pressure regulator with manometer and filter (manual purging)

B: blowdown valve, pressure regulator with manometer and filter (manual purging), pneumatic unit (4 outlets), microfilter.

C: blowdown valve, pressure regulator with manometer and filter [manual purging], pneumatic unit (1 outlets), microfilter, sub-microfilter.  
Used for sensitive applications, e.g. for air quality

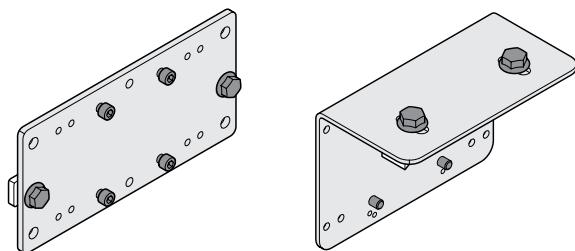

All pneumatic units are supplied with Ø12 mm outlet connectors.

### INFORMATION

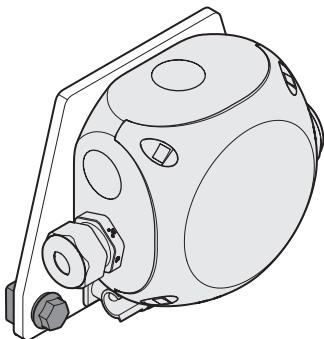

A: 2 closing + 2 opening, switch with instantaneous switching.

B: 1 closing + 1 opening, switch with instantaneous switching.

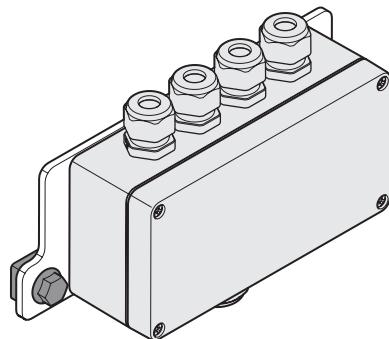

D: 1 closing + 1 opening, switch with instantaneous switching.

**ATTENTION!** Electrical work is only permitted to be performed by a trained electrician.

## CONNECTION UNITS

(A)

(D)

**INFORMATION**

A connection unit (A) must be used at the power supply end of the track system and for each bridge when using electric equipment. Threaded coupling suitable for both Ø8 - 17 mm round and 15 - 18 x 5 mm flat cables.

Connection unit (D) used for e.g. limit switch:

- 4 x M16 threaded coupling, cable Ø5 - 10 mm
- 1 x M20 threaded coupling, cable Ø10 - 14 mm
- Terminal block for 1.5 mm<sup>2</sup> wire included.

**ATTENTION!** Electrical work is only permitted to be performed by a trained electrician.
